

IPO Charts for the Employee Program – Week 09 Lab

There must be one IPO chart for each block in the hierarchy chart. In these IPO charts, the first row contains the name of the function. The second row contains the names of the parts. The third row contains the relevant information.

This document only contains IPO charts for the new functions included in this lab.

Remember that, for the IPO charts, the parts are:

- INPUTS: the parameters for the function
- PROCESS: a description of what the function does, including any relevant equations
- OUTPUTS: the values returned by the function

Never leave any of the parts blank, use the word “None” for INPUTS or OUTPUTS. The PROCESS must always have something or the function has no reason to exist.

[ui_helper.py](#)

draw_table()		
INPUTS	PROCESS	OUTPUTS
column_defs: a list of tuples with the column width and alignment headers: a list of the column headers data: a list of the records to display	Display a table header and then print each record as a table row	None

draw_column()		
INPUTS	PROCESS	OUTPUTS
width: the width of the column in characters value: the value to be displayed direction: a string representing the justification direction – must be center, left, or right	Determine the correct alignment modifier based on the direction. Build a formatted string for output. Print the string.	None

draw_bar()		
INPUTS	PROCESS	OUTPUTS
bar_size: the number of characters to display bar_character: the character to display	Prints a horizontal line of the specified character repeated the specified number of times.	None

employee_store.py

store_employee()		
INPUTS	PROCESS	OUTPUTS
employee: a list containing the attribute values for an employee record	Appends the employee record to the primary list	None

get_employee_list()		
INPUTS	PROCESS	OUTPUTS
None	Returns the current employee list	A list of the employees

employee_ui.py

get_employee_data()		
INPUTS	PROCESS	OUTPUTS
None	Prompts the user for the employee record details, adds them to a list, and returns the list	A list with the employee record

show_employee_table()		
INPUTS	PROCESS	OUTPUTS
employees: a list of employee records	Defines the table columns and column headers, then displays the employee records in a table	None

employee_handler.py

add_employee()		
INPUTS	PROCESS	OUTPUTS
None	Shows the section title, then gets an employee record and stores that record. Then lets the user know that things worked.	None

show_all_employees()		
INPUTS	PROCESS	OUTPUTS
None	Shows a section title. Then, gets a list of the current employee records. If the list is empty (i.e.: no employee records) then the function displays a message stating so. Otherwise, displays the employee records in a table.	None
